

Is your part too Heavy?

Do you need to reduce weight in your parts?

United Resin is pleased to introduce Aero-lite Resin with 205 Hardener, an epoxy system that is approximately 50% lighter than conventional potting and encapsulating epoxy systems. This product was formulated for those applications needing reduced weight, as required in aerospace, automotive, EV batteries and electronic applications. Aero-lite is a two-component epoxy system that has low density, low mixed viscosity, low shrinkage, and low CTE. Aero-lite exhibits good thermal shock & impact resistant properties. It also has excellent cosmetic qualities when cured. Since its components are hydrophobic (water repelling), moisture absorption is negligible.
